

THE SAFEST WAY TO REMOVE A TICK...

Grip its mouth parts as close to your skin surface as possible using surgical tweezers.

Pull the tick out slowly and steadily to avoid releasing or allowing tweezers to slip off parts.

CAUTION: Other removal methods could result in ticks emptying their stomach contents and disease bacteria into the bloodstream.

Removing Ticks to Prevent Lyme Disease...

- Experts believe ticks have to be attached to the host at least 24 hours to transmit Lyme disease — unless they are improperly removed.
- Carry surgical tweezers in all your first-aid kits.
- Save removed ticks for testing — in case Lyme disease symptoms develop.
- Seek medical attention if red circular rashes or any 'flu-like' symptoms appear.
